

CASE STUDY • ILLUSTRATIVE EXAMPLE

A D2C brand went from 4 product listings a week to 40, with the same one person.

THE BRAND

A ₹3Cr D2C brand selling on Amazon, Flipkart and Shopify. One person owned listings, and new SKUs sat in a spreadsheet for weeks.

The situation

Every listing was 2 to 3 hours by hand: title, description, bullets, keywords, marketplace variants and alt text. So 4 went live a week while dozens waited.

The catalog, the thing customers actually search, stayed thin. A competitor listed 40 a week and collected the long-tail searches this brand never appeared for.

What they did

- 1

Fed the pipeline just SKU data and one product photo.
- 2

AI drafted the title, description, bullets, keywords and Amazon/Flipkart variants in brand voice.
- 3

The owner reviewed and approved each in about **12 minutes** instead of 2 to 3 hours.
- 4

Listing velocity went from 4 a week to **40**, clearing the backlog in weeks.

The result, 6 months

₹2,40,000 / month in long-tail orders the catalog used to miss

Search traffic on queries the brand finally listed for. Zero new ad spend.

40 / wk

listings published, up from 4

12 min

per listing, down from 2 to 3 hours

₹0

extra acquisition cost for long-tail search

10×

faster catalog coverage than before

	BEFORE	AFTER
Listings / week	4	40
Time / listing	2-3 hrs	12 min
Catalog gap	widening	closed
Long-tail search	none	captured

More SKUs than listings?
