

CASE STUDY • ILLUSTRATIVE EXAMPLE

25 careful connection requests a day became 8 qualified meetings a month, from a channel that costs only run-time.

THE BUSINESS

A business whose **cold emails to the right list mostly got deleted**, because nobody knew the name behind them.

The situation

A connection request is one tap with zero commitment, and the moment it is accepted you are no longer a stranger. Your posts enter their feed and your first message reads as someone in my network.

Accounts that blast 200 a day get restricted, so the engine deliberately behaves like a careful human, with verification on every send.

What they did

- 1 Sent **25 targeted requests a day** to the ICP only: role, industry, geography. List quality is 80% of the game.
- 2 Added a personalised note where it earned its place, never a template blast.
- 3 Held hard daily limits and human pacing, a marathon not a sprint.
- 4 Verified every send against the sent-invitations page before counting it.

The result, per month

~8 qualified meetings a month, channel cost ~₹0

A pipeline built only from the system's run-time, on a properly targeted ICP list.

550 / mo

targeted requests sent

~30%

accept rate = 165 new ICP connections

~30

real conversations a month

~8

qualified meetings a month

	BEFORE	AFTER
Channel cost	high	~₹0
First contact	stranger	in-network
Meetings / mo	few	~8
List	broad	ICP only
